

Automated Regulatory Compliance

Reduce regulatory costs and information security expenditures through automated processing. Overlapping regulations and ad-hoc manual processes consume vast amounts of resources that would be better spent helping the business excel. By leveraging automated processes, organizations can reduce their audit footprint significantly.

Identity Management & Access Auditing

E-Discovery, Data Loss Prevention (DLP) and other information-based security controls cannot provide the information necessary to understand what someone has been doing in the environment. A centralized and normalized dataset allows organizations to be able to describe a particular individual's behavior with a click of a button.

Auditing Mobility & Cloud Security Controls

Mobility, consumerization, and cloud-based services are quickly becoming a mainstay within the enterprise. Embracing mobility & cloud enables organizations to deliver in shorter time cycles and often with less up-front costs & transferred risk. Nth Generation helps organizations leverage these solutions while continuing to keep security management efficient and cost effective.

Log Management

Log management allows organizations to centralize, normalize, and correlate events being logged by applications, operating systems, security controls, and infrastructure equipment. Centralized control objectives allow organizations to take multiple regulations and/or business requirements and harmonize them into a single cohesive set of objectives.

Security Information & Event Management (SIEM)

SIEM solutions identify correlations and control violations that individual solutions can't access. By bringing together logs from physical security devices, applications, networks, security countermeasures, and management tools organization's can gain transparent visibility into what is occurring in the environment. Nth Generation provides architectural, presales, postsales, management, and governance solutions.
